
(a) Temporal Conditional Source Distribution
Input graphs $\mathcal{G}_{i,\leq t}$
0
t
T
?
g_ϕ
Temporal condition $\mathcal{C}$
$\mathcal{N}(0, \sigma^2 I)$
Gaussian Graph Residual Field
$\mathcal{N}(0, \sigma^2 (I + \alpha L_c)^{-1})$
$d\boldsymbol{r}_{i,j,\tau} = v_\theta^A(\boldsymbol{r}_\tau^X, \tau)d\tau$ $d\boldsymbol{R}_\tau^X = v_\theta^X(\boldsymbol{R}_\tau^X, \tau)d\tau$
$\boldsymbol{z}_{T-1}$
$\boldsymbol{z}_T$
$\boldsymbol{R}_\tau^X$
$\boldsymbol{r}_0^X$
$\boldsymbol{R}_0^X$
Edge Source
Node Source
True States
Multi-steps transport target
T
T − 1
node change ↔ edge reorganization
(b) Joint Node-Edge Flow
